

Breast Cancer

This patient's first tumor marker was 185.7 revealing already metastasized cancer cells and a lumpectomy found three cancerous lymph nodes.

In just 4 weeks-

- ✓ Tumor Marker Dropped 106.9 points!!!
- ✓ Patient Is Elated!!
- ✓ Refused Chemo & Radiation Treatment Due To Outstanding Results
- ✓ Blood Pressure Consistently Improving

Initial Symptoms-

- ✓ Breast Cancer-Ductal Carcinoma
- ✓ Hot Flashes
- ✓ High Blood Pressure – taking Norvasc and Hydrochlorothiazide
- ✓ On Fosamax for Osteoporosis

Between May 4th and August 17th of 2007, the cancer marker dropped a total of 156 points! The results speak for themselves – you do not have to pollute your body with radiation and chemotherapy treatments to reduce cancer cells.

Patient Profile:

05-04-07 – Diagnosed with breast cancer just 2 months ago at 48-years old, this patient faced a very tough decision. Doctors said she had ductal carcinoma, a very common type of breast cancer in women where the cancer cells develop within the milk ducts of the breast then slowly spread into surrounding tissue. They recommended surgery/biopsy and placed her on the schedule for late May. Looking for another option, the patient came to Back To Health Center. At the time of her initial visit, she weighed 123 lbs at 5'6" and her blood pressure was 120/76. The patient took the Hormone Replacement Therapy drug Premarin for nine years after having a partial hysterectomy but immediately stopped after the cancer diagnosis. She used to be a regular smoker, but quit within the last 5 years. Right now it takes two medications (Norvasc and Hydrochlorothiazide) to control her high blood pressure and the patient is also on Fosamax for Osteoporosis. She was using a few basic vitamins, but during our first meeting I made several recommendations to aid her body in fighting cancer and then immediately sent her to the lab for a tumor marker to see how far her cancer had

progressed. In addition to breast cancer and high blood pressure this patient also suffers from hot flashes and night sweats.

Patient's tests results:

05-05-07 – Obviously the breast cancer tumor marker CA 27.29 is too high at 185.70 showing it has already metastasized. Several other areas also need improvement such as Glucose and Hemoglobin A1C. The low T7 indicates a low functioning thyroid which can slow digestion, reduce energy and lower the immune system. We can see signs of anemia in the low red blood count, hemoglobin and hematocrit. A low white blood count and high Platelets may be due to an infection and are additional signs of a decreased immune system. Finally the Creatine Kinase, LDH and C-Reactive protein are all a little high indicating chronic tissue injury or inflammation.

Results of Initial Blood Test:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
Glucose	05/04/2007	100.00	HI			80.00 - 95.00	65.00 - 99.00

CRP C-Reactive Protein		4.30	hi			0.00 - 1.50	0.00 - 4.90
CA 27.29		185.70	HI			0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

We wanted to see what toxins and heavy metals may be binding up processes in the body, so the patient did a chelating test using the agent DMSA. The column labeled "Pre-Chall" shows the amount the body is able to eliminate on its own. The column labeled "DMSA" is the level of toxic metals excreted with the help of a chelating agent. Both Lead and Mercury increased significantly with this test.

Results of Chelation:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
Agent		DMSA		Pre-Chall			
Dose		1000 mg					
Interval		6		6			
Toxic Elements							
Aluminum (UA)		0.00	Opt	53.00	😊	0- 12.00	12.01- 25.00
Antimony (UA)		0.00	Opt	0.20		0- 0.50	0.51- 1.00

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

Doctor analysis:

05-18-07 – Cancer feeds on sugar, so reducing sugars and carbs in the diet will not only keep this patient out of the diabetic range but potentially slow cancer cell growth. There are several markers in the blood that show a lowered immune system (low thyroid, low white blood count and high Platelets) which we need to boost to allow the patient to efficiently ward off cancerous cells. Interestingly, most cancers are seen in people with a low thyroid function because the thyroid controls the basal metabolic rate, which is the speed at which the body heals and repairs itself. Another result we will be watching is the LDH which currently shows a high level of cell destruction likely due to cancer. We also need to reduce the anemia because it interferes with the body’s ability to transport oxygen and nutrients. Our goal is to correct the multiple small problems in the body so the immune system can focus exclusively on fighting back cancerous cells.

Another thing we must consider is the high level of toxic elements Lead and Mercury. In the chelation test the patient’s Lead value jumped from 1.1 to 62 showing the body cannot

easily eliminate this toxic metal on its own and over time this allowed Lead to slowly build to a very high level. This load needs to be reduced because Lead is stored in the bone and causes calcium and selenium depletion. The patient is taking Fosamax for Osteoporosis and a prescription women's vitamin called Encora which contains high doses of Calcium and Vitamin D. These drugs were prescribed to help strengthen her bones, but neither will correct the cause of calcium depletion which appears to be a heavy Lead load. By eliminating this toxic element, her need for Fosamax and Encora should diminish.

Mercury climbed from 1.8 to 9.7 once again showing the body's inability to eliminate heavy metals. This toxin depletes Selenium (a major anti-oxidant), zinc (boosts immune system) and copper (a cofactor for superoxide dismutase, an important antioxidant). It's important to eliminate as much of these two toxic elements as possible because they take vital nutrients out, binding up healing processes in the body which gives cancerous cells a better chance at thriving.

About a week after her first blood test, the patient had a second tumor marker done. The number dropped **45.7 points** without ANY medical intervention – no surgery/biopsy, chemo, radiation or hormone therapy! Just by taking the vitamins I recommended during the initial consultation she was able to improve. I updated her vitamin regimen based on the complete blood test, placed her on a chelation schedule to eliminate heavy metals and ordered a retest of the CA 27.29 in two weeks.

Results of 2nd Tumor Marker:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
CA 27.29	05/11/2007	140.00	HI	185.70	☺	0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

05-24-07 – The patient received the results from her lumpectomy and three out of three lymph nodes returned as positive. Daily radiation treatments were recommended for six weeks to be followed by rounds of chemo. Then doctors recited the news, “Based on these results, if you complete the cycles of radiation and chemo you probably have 8-10 years to live.” The oncologist thought this was a fairly good prognosis but at 48-years old, the patient justifiably disagreed! She declined their recommendations and continued with supplemental treatment.

Patient assessment:

06-07-07 – After just *four weeks* under our care, the patient's CA 27.29 plunged a total of 106.9 points! This is incredible progress and shows that the patient is sticking to the diet and consistently taking all the recommended supplements. When battling diseases such as this, there is no room for cheating. Patients must make the lifestyle changes necessary to keep them alive, because with cancer it is absolutely a matter of life or death.

Results of 3rd Tumor Marker:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
CA 27.29	06/07/2007	78.80	HI	140.00	😊	0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

06-29-07 – Moving out of the blue zone, a recheck of the CA 27.29 three weeks later showed continued improvement with the marker coming down an additional 33 points! The patient could not be happier and is thankful she did not follow the drug protocol recommended by doctors. We kept the vitamin list the same as it was clearly working and continued with weekly chelation treatments.

Results of 4th Tumor Marker:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
CA 27.29	06/29/2007	45.80	HI	78.80	😊	0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

07-16-07 – Two weeks later, the CA 27.29 moved from red to yellow showing that while the tumor marker is still a little high, it is no longer above the clinical range.

Results of 5th Tumor Marker:

Test Description	Date:	Current Result	Current Rating	Prior Result	Delta	Healthy	Clinical
CA 27.29	07/16/2007	35.50	hi	45.80	😊	0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

08-17-07 – We retested the tumor marker earlier this month on 8-06 and it showed consistent improvement dropping to 30.7. In addition, the patient is now off both Fosamax and Hydrochlorothiazide and has reduced her dosage of Norvasc to just one pill per day.

We checked her Blood Pressure and it is better now at 118/74 than it was in May with the help of two prescriptions!

The patient saw her oncologist this month who took a tissue biopsy to determine if the cancer would be likely to return. The tissue results returned as "normal" but doctors want to do an MRI next month. She also had a CAT scan with dye last week on her head, chest and abdomen which I advised may cause the CA 27.29 to increase slightly. Doctors saw a small dot on the lungs and will retest this in three months. I decided to run a second full blood panel to check the CA 27.29 and other areas of concern such as the low thyroid. Since a dot appeared on the CAT scan, I also ordered another tumor marker called CA 19-9 to determine if the cancerous cells may have spread into other areas of the body.

Results of 2nd Complete Blood Test:

CA 27.29		29.70	hi	185.70	☺	0.00 - 0.00	0.00 - 38.60

Blue = clinically very high or clinically very low

Red = clinically high or clinically low

Yellow = a little high or a little low; this can be considered a warning sign that the value is not optimal.

In spite of the dyes and medical scans, the CA 27.29 came down once again to 29.70. The CA 19.9 is also good at 11 showing the cancerous cells are not spreading. Her Glucose is within the optimal range and the Creatine Kinase which measures tissue injury and inflammation dropped 56 points! The Red Blood Count, Hemoglobin and Hematocrit all improved allowing oxygen and minerals to be transported more efficiently through the body. A few things became worse such as the calcium, phosphorus and low thyroid which may be associated with the chelation treatment where Lead and Mercury are being flushed out of the body. Her total cholesterol came down several points but the Triglycerides went up and this is something that we need to work on. These fats are main constituents of vegetable oil and animal fats, but the high number may be partially caused by a low functioning thyroid.

Letter From The Patient:

My Favorite Doctor!!! I wanted to thank you for all of your help, caring, support and expertise in my battle with breast cancer. I did not have to go through the pain and agony of radiation and hormone treatments, while I watched it deteriorate my body and immune system. I am happy, healthier, strong and cancer free and it's all because of you.

Thank you, Thank you! You are a blessing!

Final Thoughts:

Between May 4th and August 17th, this patient's cancer marker dropped a total of 156 points! The results speak for themselves – you do not have to pollute your body with radiation and chemotherapy treatments to reduce cancer cells.

Over the course of a lifetime, statistics say one in eight women will be diagnosed with breast cancer. The American Cancer Society estimates there will be nearly 180,000 new cases of breast cancer in 2007 in the United States alone. That's 180,000 mothers, daughters, and friends facing the same diagnosis as my patient; being told they have “___ years to live” and constantly battling the side effects of medical treatment. There are better and safer options as can clearly be seen in this patient's test results.

This was an interesting case as my patient stood very much alone in her treatment. Her husband and family members all urged her to follow the recommendations of the oncologist who technically told her she would be

dead by 58. Despite this obstacle, she maintained a positive, joyful attitude over the past several months which no doubt aided her recovery.
